

Email Sending Failed: Call to undefined function WHMCS\Module\logAdminActivity()

Symptoms

After updating to WHMCS 8.8, some emails fail to send using a Microsoft email service with OAuth (for example, Microsoft Outlook or Microsoft 365).

The system logs a `Call to undefined function` error at **Configuration > System Log**:

```
Email Sending Failed: Call to undefined function WHMCS\Module\logAdminActivity()
```

Cause

This error indicates an issue with the logging of the storage of the OAuth refresh token for emails that visitors or clients trigger.

Hotfix

We have created a hotfix for WHMCS 8.8.0 to correct the logging issue. You can download it at:
