

Troubleshooting Themes Named "WHMCS Six Theme"

Symptom

After updating to v8.1, you observe one or more entries in the System Theme dropdown menu on the **Configuration > System Settings > General Setting > General tab** page labelled:

- WHMCS Six Theme

Cause

A custom template was created based on the Six theme, which contains a `theme.yaml` file specifying the theme name *WHMCS Six Theme*.

In WHMCS v8.0 and earlier, the Theme Name is determined by the `/templates` sub-directory name, eg. `/templates/my-template-name`

WHMCS v8.1 looks first for a `theme.yaml` file in the corresponding `/templates` sub-directory and shows the name specified therein. If the file is not present then the directory name is shown instead.

As a result the the Theme Name from the `theme.yaml` file is now being displayed:

```
# WHMCS Six Theme Configuration File

name: "WHMCS Six Theme"
description: "The Default Theme for WHMCS Version 6.0"
author: "WHMCS Limited"
properties:
  serverSidePagination: false # Defines client side will handle pagination
```

Solution

1. Edit the `/templates/my-template-name/theme.yaml` file.

Where *my-template-name* is the name of your custom template sub-directory.

2. Change the **name** value to the desired name for your template
3. Optionally also specify a **description** and your name as the **author**
4. Save the theme.yaml file. For example it might look like:

```
# My Theme Configuration File

name: "My Custom Theme"
author: "My Company"
properties:
  serverSidePagination: false # Defines client side will handle pagination
```
