

# Creating Your First Plesk Server

Before you can sell and provision hosting accounts, you must add at least one server to your WHMCS installation. The steps below create a Plesk server in WHMCS.

## Creating a Plesk Server

To add your server to WHMCS:

1. Create an API token on the Plesk server. For steps to do this, see [Plesk's documentation](#).
2. Log in to the WHMCS Admin Area.
3. Go to **Configuration > System Settings > Servers (Setup > Products/Services > Servers** in WHMCS 7.10 and earlier).
4. Click **Add New Server**.
5. Select *Plesk* for **Module**.
6. Enter the server hostname or IP address and your Plesk reseller username and password.
7. If you have a non-standard ( 8443 ) port for Plesk, enter the port number in the **Access Hash** section.

The screenshot shows the 'Add New Server' form in WHMCS. The 'Module' dropdown is set to 'Plesk'. Below it, there are input fields for 'Hostname or IP Address', 'Username', 'Password', and 'Access Hash'. The 'Access Hash' field is a larger text area. At the bottom right, there are two buttons: 'Test Connection' (blue) and 'Continue Anyway' (grey).

 For help with these details, contact your hosting provider or system administrator.

8. Click **Test Connection** to ensure that WHMCS is able to communicate. A success message will appear.

9. Click **Save Changes**. The **Servers** interface will appear, displaying the newly-added server in the list.

Servers

Server Added Successfully!

The new server has been added and is now ready for use.

This is where you configure all your servers so that WHMCS can communicate with them. The default server for each module is marked with an asterisk \*. You must select a default server for automatic setup to function correctly.

+ Add New Server

+ Create New Group
