

# Updating the System URL

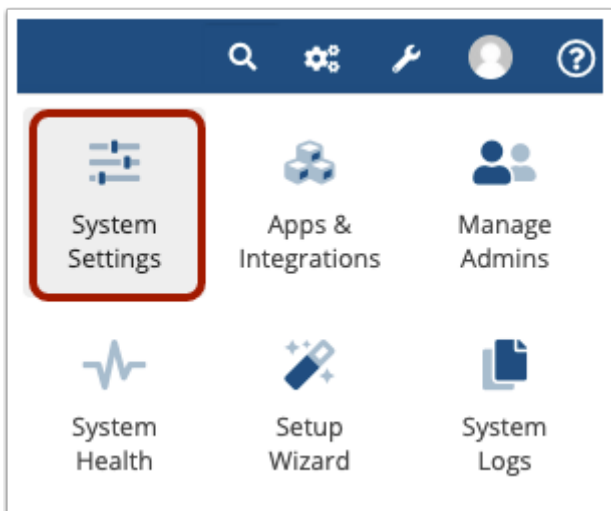

To ensure that your WHMCS installation can function, your system URL setting must be correct at all times.

❗ After moving a WHMCS installation you **must** update **WHMCS System URL** to reflect the new location.

## Update the System URL Setting

To update your system URL:

1. Go to **Configuration > System Settings > General Settings**.

2. Select the **General** tab.
3. Enter the correct URL in **WHMCS System URL**.

WHMCS System URL	<input type="text" value="https:// /whmcs/"/>
The URL to your WHMCS installation (SSL Recommended) eg. https://www.example.com/members/	

💡 For example, if `example.com` uses an SSL certificate and the WHMCS installation is in the `whmcs` directory, the system URL would be:

```
https://www.example.com/whmcs/
```

In this case, starting the URL with `http://`, omitting the `www`, or other deviations could cause errors. The system URL must match **exactly**.

4. Click **Save Changes**.
